BLACKCURRANT

UPOV Code: RIBES_NIG

Ribes nigrum L.

*

GUIDELINES

FOR THE CONDUCT OF TESTS

FOR DISTINCTNESS, UNIFORMITY AND STABILITY

Alternative Names:^{*}

| Botanical name | English | French | German | Spanish |
|---|--------------------------------|--------|---------------------------|----------------------------|
| <i>Ribes nigrum</i> L., <i>Ribes dicuscha</i> Fisch. ex Turcz., <i>Ribes ussuricense</i> Jancz. | Blackcurrant, Black Currant | Cassis | Schwarze Johannisbeere | Grosellero negro, Casis |

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

Other associated UPOV documents: TG/138 *Ribes ×nidigrolaria* R. & A. Bauer

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Ribes nigrum* L. (*Ribes dikuscha* Fisch. ex Turcz. and *Ribes ussuricense* Jancz.), of the family *Grossulariaceae*.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of hardwood cuttings (without roots), rooted hardwood cuttings or in the form of plants with at least three shoots.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

10 hardwood cuttings (without roots),
5 rooted hardwood cuttings, or
5 plants with at least three shoots.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

3.1.1 The minimum duration of tests should normally be two independent growing cycles.

3.1.2 The growing cycle is considered to be the duration of a single growing season, beginning with vegetative bud burst, flowering and fruit harvest and concluding when the following dormant period ends with the swelling of new season buds.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination. In particular, it is essential that the plants produce a satisfactory crop of fruit in each of the two growing cycles.

3.4 *Test Design*

- 3.4.1 Each test should be designed to result in a total of at least 5 plants.
- 3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 5 plants or parts taken from each of 5 plants. In the case of observations of parts taken from single plants, the number of parts to be taken from each of the plants should be 2.

3.6 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 5 plants, no off-types are allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new plant stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) One-year-old shoot: color (characteristic 4)
- (b) Young shoot: anthocyanin coloration (characteristic 10)
- (c) Fruit: color (characteristic 26)
- (d) Time of beginning of fruit harvest (characteristic 30)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 *Legend*

(*) Asterisked characteristic – see Chapter 6.1.2

QL: Qualitative characteristic – see Chapter 6.3

QN: Quantitative characteristic – see Chapter 6.3

PQ: Pseudo-qualitative characteristic – see Chapter 6.3

(a)-(d) See Explanations on the Table of Characteristics in Chapter 8.1

8. Explanations on the Table of Characteristics

8.1 *Explanations covering several characteristics*

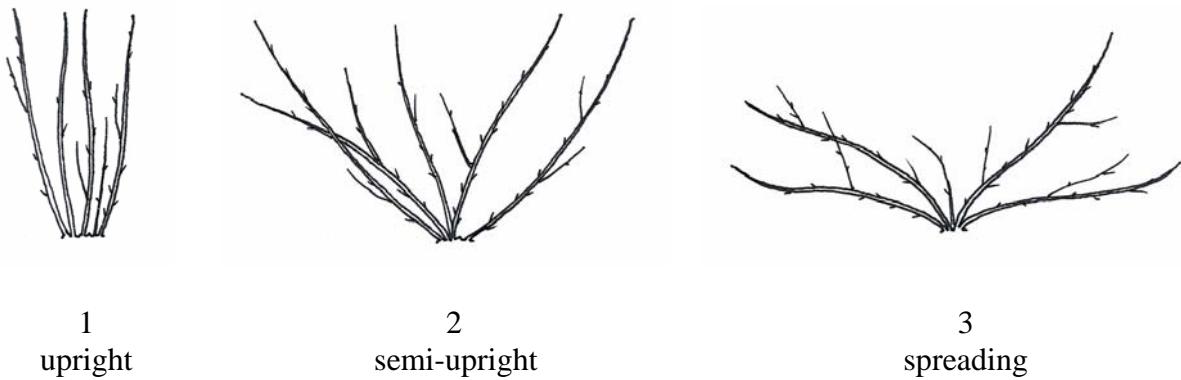

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) Plant, one-year-old shoot and vegetative bud: All observations should be made on dormant bushes in winter after at least one growing season. Vegetative bud: All observations should be made in the middle third of one year old shoots, before bud burst.
- (b) Young shoot, leaf blade, petiole: All observations should be made in early summer. For leaf blade and petiole, mature leaves from the middle third of one year old shoots from the outside of the bush should be observed.
- (c) Inflorescence, sepal, ovary: All observations should be made at full flowering.
- (d) Infructescence: Unless otherwise stated, all observations should be made just before harvest. The infructescence is also known as the fruit truss or strig.
- (e) Fruit: Unless otherwise stated, all observations should be made after harvest.

8.2 *Explanations for individual characteristics*

Ad. 2: Plant: growth habit

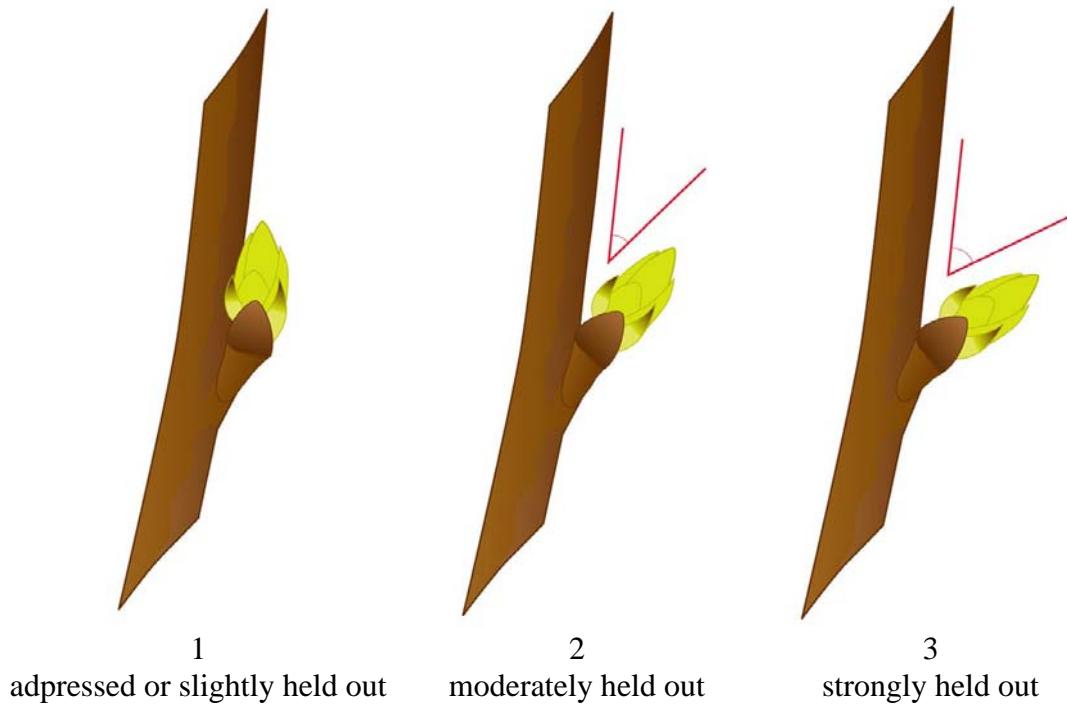

The growth habit is assessed using the relationship between plant height and plant width: an upright variety is taller than broad; a semi upright variety is approximately the same height as the width; a spreading variety is broader than tall.

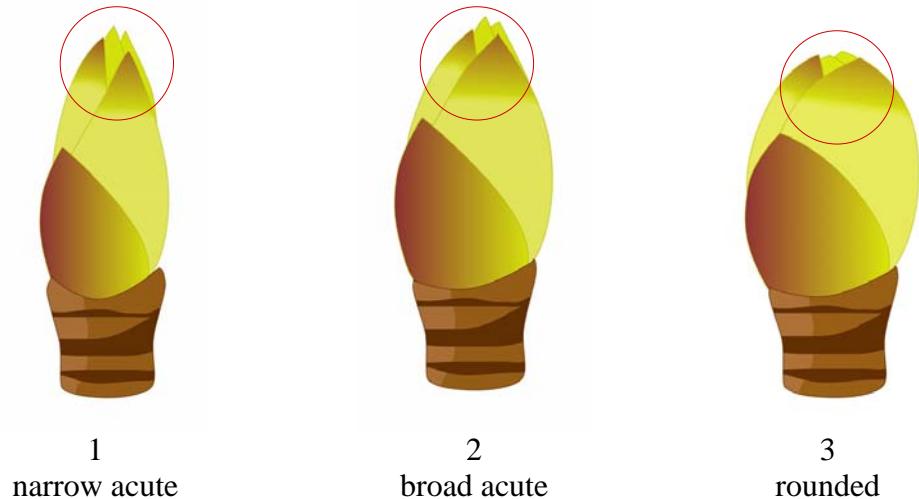

Ad. 4: One-year-old shoot: color

Observations should be made on the middle third of a shoot on the outside of the bush.

Ad. 5: Vegetative bud: position in relation to shoot

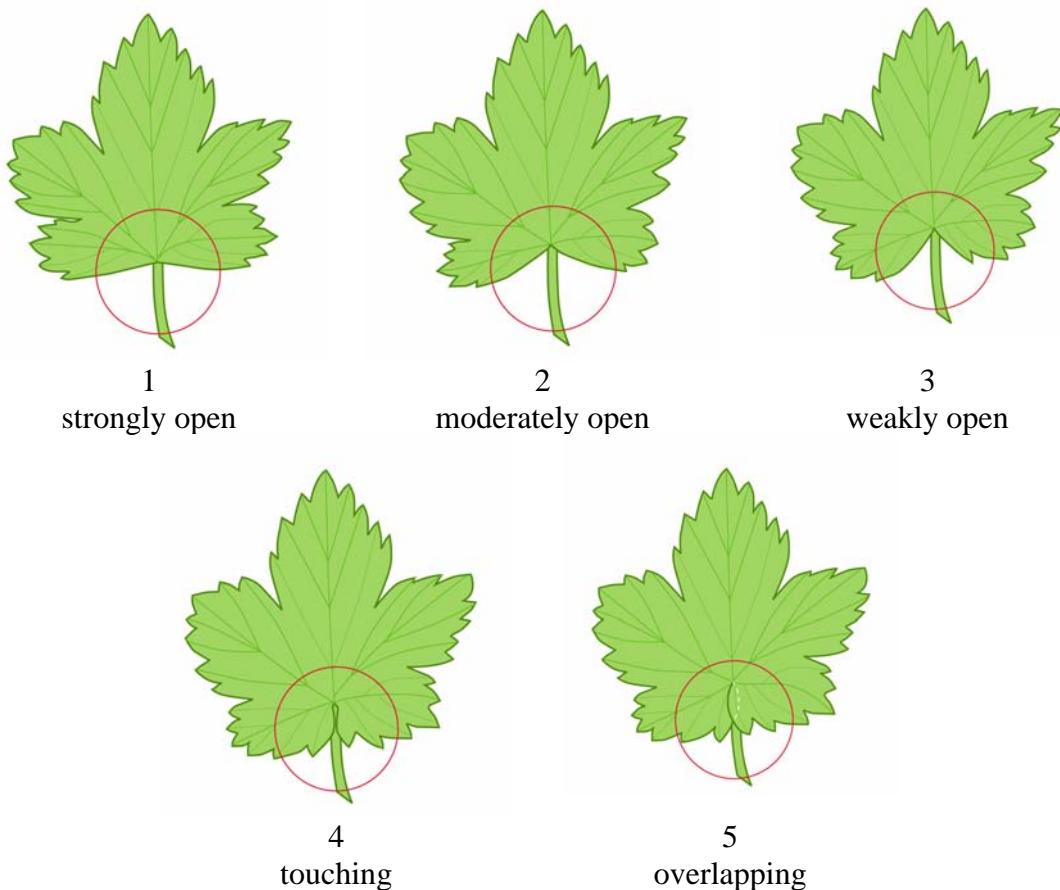

Ad. 7: Vegetative bud: shape of apex

Ad. 9: Vegetative bud: bloom

Vegetative bud bloom refers to the level of glaucosity on the bud.

Ad. 14: Leaf blade: base

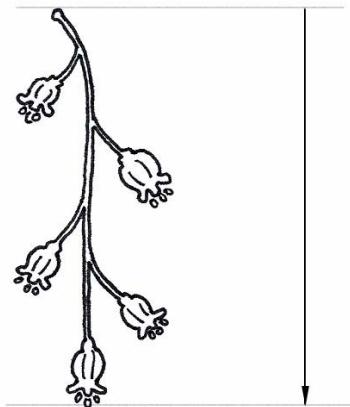

Ad. 18: Plant: number of inflorescences per axil

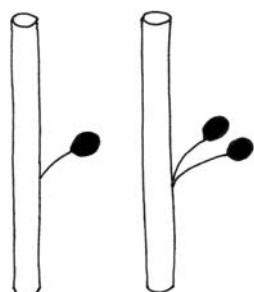

The number of inflorescences per axil is determined by observing the leaf axils in the upper third of a one year old shoot, at flowering.

Ad. 19: Inflorescence: length

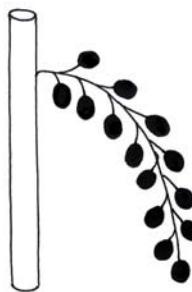

The inflorescence length includes the peduncle.

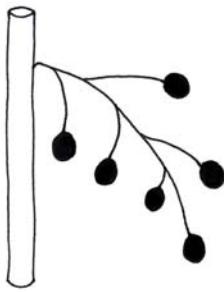

Ad. 23: Infructescence: type

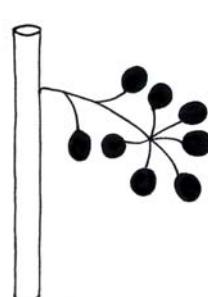

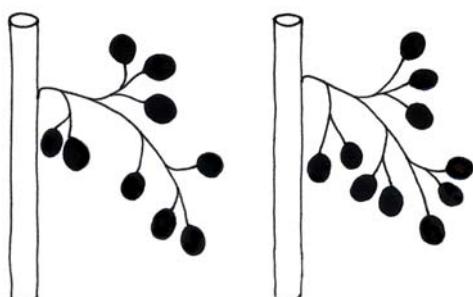

simple

raceme

panicle 1

panicle 2

Ad. 24: Infructescence: range of fruit size

The range of fruit size is determined by observing the range of individual fruit sizes within a single infructescence (fruiting truss).

Ad. 25: Fruit: size

Fruit size can be assessed by weight because the density of fruit flesh of all varieties is very similar. Fruit size should be determined by the weight of a minimum of 50 fruits, covering all fruit sizes present, harvested from the 5 plants.

Ad. 28: Time of beginning of vegetative bud burst

The time of beginning of vegetative bud burst is when the first green leaves on a bud are just visible.

Ad. 29: Time of beginning of flowering

The time of beginning of flowering is when 10% of flowers are fully open.

Ad. 30: Time of beginning of fruit harvest

The time of fruit harvest is when 10% of fruits have achieved full color.

#4. Information on the breeding scheme and propagation of the variety

4.1 Breeding scheme

Variety resulting from:

4.1.1 Crossing

- (a) controlled cross []
(please state parent varieties)
- (b) partially known cross []
(please state known parent variety(ies))
- (c) unknown cross []

4.1.2 Mutation

(please state parent variety)

[]

4.1.3 Discovery and development

(please state where and when discovered
and how developed)

[]

4.1.4 Other

(please provide details)

[]

4.2 Method of propagating the variety

4.2.1 Vegetative propagation

- (a) cuttings []
- (b) *in vitro* propagation []
- (c) other (state method) []

4.2.2 Other

(please provide details)

[]

* Authorities may allow certain of this information to be provided in a confidential section of the Technical Questionnaire.

| TECHNICAL QUESTIONNAIRE | Page {x} of {y} | Reference Number: |
|--|--------------------|-------------------|
| Characteristics | Example Varieties | Note |
| 5.1 Plant: growth habit (2) | | |
| upright | Magnus, Westra | 1[] |
| semi-upright | Baldwin, Blackdown | 2[] |
| spreading | Tenah | 3[] |
| 5.2 One-year-old shoot: color (4) | | |
| yellow brown | Tenah | 1[] |
| red brown | | 2[] |
| brown | Hatton Black, Jet | 3[] |
| grayish | Cotswold Cross | 4[] |
| 5.3 Young shoot: anthocyanin coloration (10) | | |
| absent or very weak | Goliath | 1[] |
| weak | Roodknop | 3[] |
| medium | Hatton Black | 5[] |
| strong | Malvern Cross | 7[] |
| 5.4 Fruit: size (25) | | |
| small | Goliath, Sarolata | 3[] |
| medium | Baldwin | 5[] |
| large | Titania | 7[] |
| very large | Bona | 9[] |

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- (a) Microorganisms (e.g. virus, bacteria, phytoplasma) Yes [] No []
(b) Chemical treatment (e.g. growth retardant, pesticide) Yes [] No []
(c) Tissue culture Yes [] No []
(d) Other factors Yes [] No []

Please provide details for where you have indicated "yes".

.....

9.3 Has the plant material to be examined been tested for the presence of virus or other pathogens?

Yes []

(please provide details as specified by the Authority)

No []

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:

Applicant's name

Signature

Date
